

NETWORK - BASED ACCESSIBILITY ANALYSIS

Using GIS network analysis to compare service accessibility based on travel distance and travel time.

How do accessibility patterns change when service areas are measured by driving distance versus driving time?

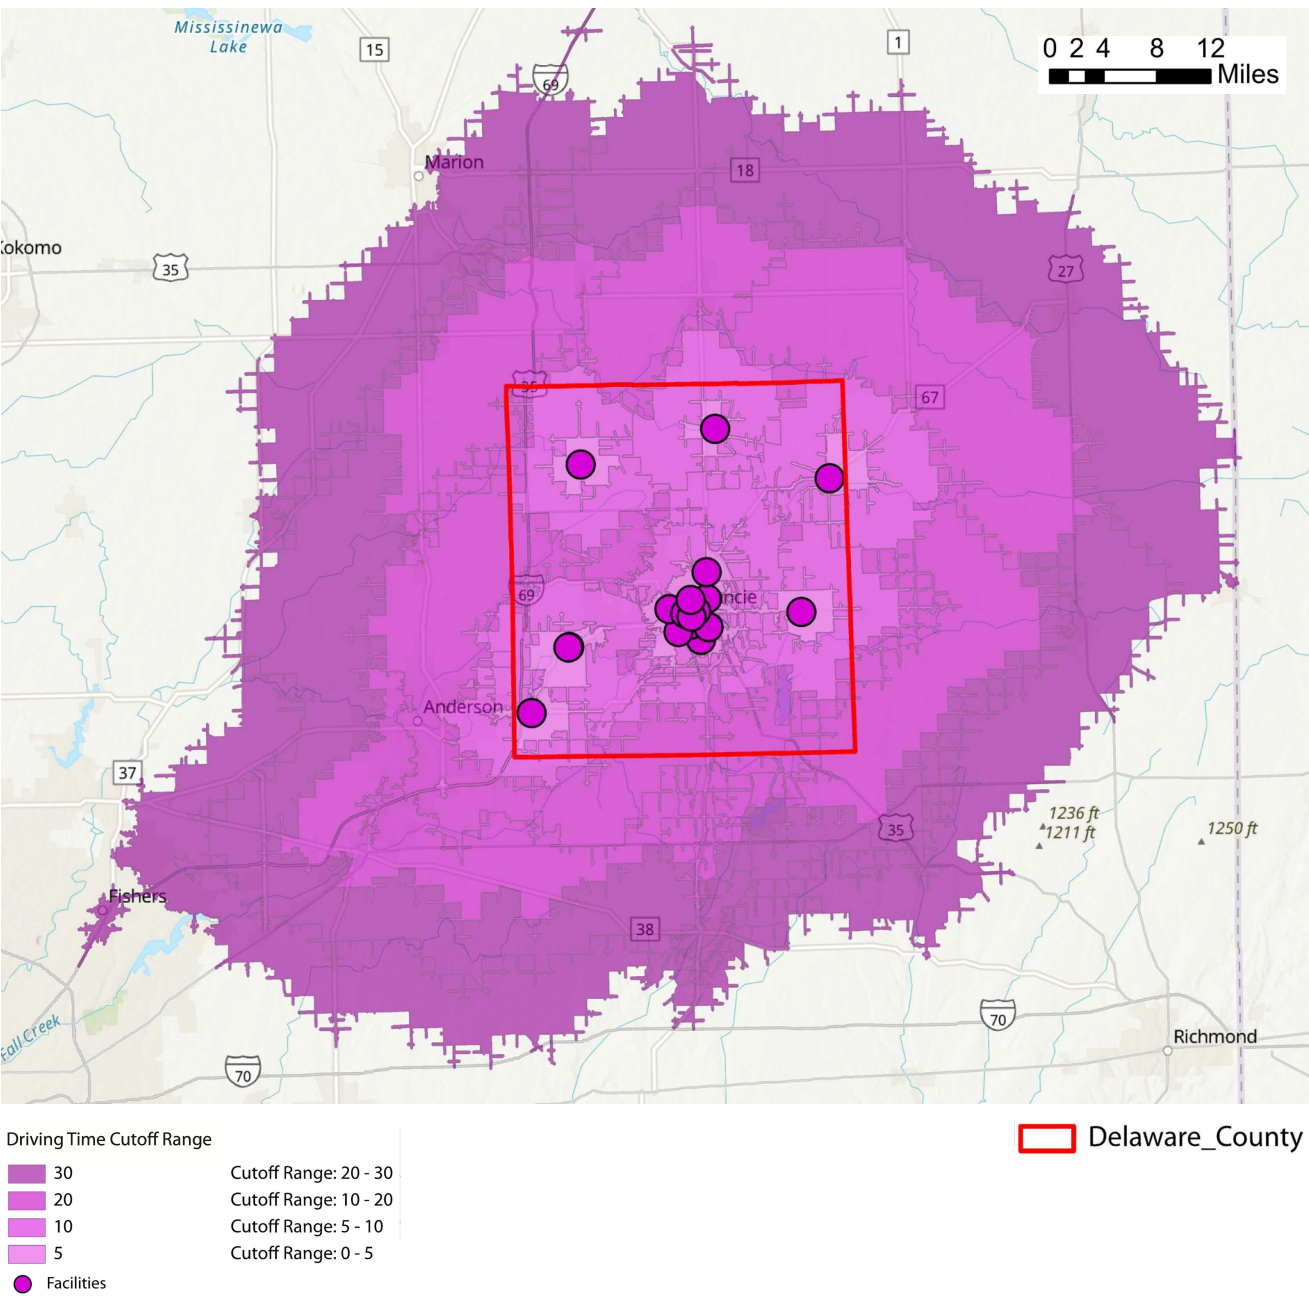

Driving Distance

Planning Insight

Distance-based service areas help evaluate geographic coverage and identify locations with limited physical access to facilities.

Driving Time

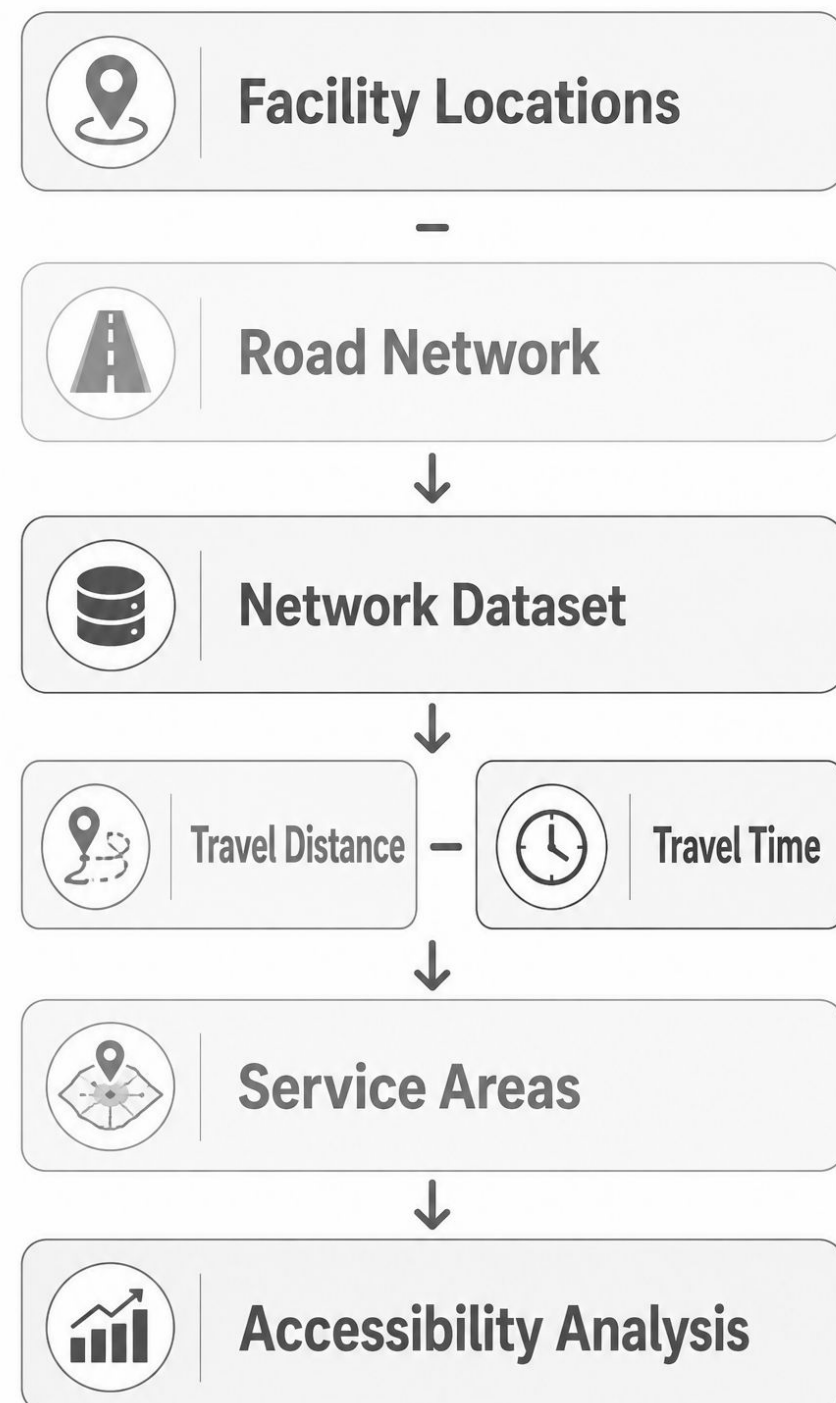

Planning Insight

Travel time better reflects real-world accessibility by accounting for road connectivity and travel efficiency.

UNDERSTANDING NETWORK ANALYSIS

Evaluating how transportation networks influence accessibility.

PLANNING APPLICATIONS OF NETWORK ANALYSIS

Network analysis measures accessibility through the transportation network rather than straight-line distance, providing more realistic information for planning, infrastructure, and public service decisions.
